Attempt : 1 Total Mark : 20 Marks Obtained : 20

Section 1: MCQ

1. Let P be a quick sort program to sort numbers in ascending order using the first element as a pivot. Let t1 and t2 be the number of comparisons made by P for the inputs {1, 2, 3, 4, 5} and {4, 1, 5, 3, 2}, respectively. Which one of the following holds?

#### Answer

t1 > t2

Status: Correct Marks: 1/1

2. Why is Merge Sort preferred for sorting large datasets compared to Quick Sort?

#### Answer

Merge Sort has better worst-case time complexity

Status: Correct Marks: 1/1

3. In a quick sort algorithm, where are smaller elements placed to the pivot during the partition process, assuming we are sorting in increasing order?

#### Answer

To the left of the pivot

Status: Correct Marks: 1/1

4. Which of the following modifications can help Quicksort perform better on small subarrays?

#### Answer

Switching to Insertion Sort for small subarrays

Status: Correct Marks: 1/1

5. The following code snippet is an example of a quick sort. What do the 'low' and 'high' parameters represent in this code?

```
void quickSort(int arr[], int low, int high) {
   if (low < high) {
      int pivot = partition(arr, low, high);
      quickSort(arr, low, pivot - 1);
      quickSort(arr, pivot + 1, high);
   }
}</pre>
```

#### Answer

The range of elements to sort within the array

Status: Correct Marks: 1/1

6. Which of the following sorting algorithms is based on the divide and conquer method?

Answer

Merge Sort

Status: Correct Marks: 1/1

7. Consider the Quick Sort algorithm, which sorts elements in ascending order using the first element as a pivot. Then which of the following input sequences will require the maximum number of comparisons when this algorithm is applied to it?

**Answer** 

22 25 56 67 89

Status: Correct Marks: 1/1

8. What happens during the merge step in Merge Sort?

Answer

Two sorted subarrays are combined into one sorted array

Status: Correct Marks: 1/1

9. Which of the following is not true about QuickSort?

Answer

It can be implemented as a stable sort

Status: Correct Marks: 1/1

10. What happens when Merge Sort is applied to a single-element array?

Answer

The array remains unchanged and no merging is required

Status: Correct Marks: 1/1

041	11. What is the main advantage of Quicksort over Merge Sort?  **Answer**	0475070
. 1	Quicksort requires less auxiliary space	`V
	Status: Correct	Marks : 1/1
	12. Which of the following statements is true about the merge salgorithm?	sort
	Answer	
	It requires additional memory for merging	
. ^	It requires additional memory for merging  Status: Correct	Marks : 1/1
200	, Ja,	24,
	13. Is Merge Sort a stable sorting algorithm?	
	Answer	
	Yes, always stable.	
	Status: Correct	Marks : 1/1
	14. Which of the following is true about Quicksort?	
. ^	Answer	1,5010
20,	It is an in-place sorting algorithm	2ª,
	Status: Correct	Marks : 1/1
	15. Merge sort is	
	Answer	
	Comparison-based sorting algorithm	
	Status: Correct	Marks : 1/1
	6010	5010

16. Which of the following methods is used for sorting in merge sort? Answer merging Status: Correct Marks: 1/1 17. Which of the following strategies is used to improve the efficiency of Quicksort in practical implementations? Answer Choosing the pivot randomly or using the median-of-three method Status: Correct Marks: 1/1 18. Which of the following scenarios is Merge Sort preferred over Quick Sort? Answer When sorting linked lists Status: Correct Marks: 1/1 19. What is the best sorting algorithm to use for the elements in an array that are more than 1 million in general? **Answer Quick sort.** Status: Correct Marks: 1/1 20. In a quick sort algorithm, what role does the pivot element play?

Answer

It is used to partition the array

Status: Correct Marks: 1/1

Section 1: Coding

### 1. Problem Statement

John and Mary are collaborating on a project that involves data analysis. They each have a set of age data, one sorted in ascending order and the other in descending order. However, their analysis requires the data to be in ascending order.

Write a program to help them merge the two sets of age data into a single sorted array in ascending order using merge sort.

## **Input Format**

The first line of input consists of an integer N, representing the number of age values in each dataset.

The second line consists of N space-separated integers, representing the ages of participants in John's dataset (in ascending order).

The third line consists of N space-separated integers, representing the ages of participants in Mary's dataset (in descending order).

### **Output Format**

The output prints a single line containing space-separated integers, which represents the merged dataset of ages sorted in ascending order.

Refer to the sample output for formatting specifications.

### Sample Test Case

```
Input: 5
13579
    108642
    Output: 1 2 3 4 5 6 7 8 9 10
    Answer
    #include <stdio.h>
    // You are using GCC
    void merge(int arr[], int left[], int right[], int left_size, int right_size) {
       int i = 0, j = 0, k = 0;
       // Merge while both arrays have elements
       while (i < left_size && j < right_size) {
         if (left[i] <= right[j]) {
            arr[k++] = left[i++];
         } else {
           arr[k++] = right[j++];
         }
       // Copy remaining elements of left[], if any
       while (i < left_size) {
         arr[k++] = left[i++];
       // Copy remaining elements of right[], if any
       while (j < right_size) {
}//Type your code here
```

```
void mergeSort(int arr[], int size) {
  if (size < 2)
     return; // Base case: arrays of size 1 are sorted
  int mid = size / 2;
  // Create left and right subarrays
  int left[mid];
  int right[size - mid];
  for (int i = 0; i < mid; i++) {
     left[i] = arr[i];
  for (int i = mid; i < size; i++) {
   right[i - mid] = arr[i];
  // Recursive calls to sort left and right subarrays
  mergeSort(left, mid);
  mergeSort(right, size - mid);
  // Merge sorted halves back into arr[]
  merge(arr, left, right, mid, size - mid);//Type your code here
}
int main() {
  int n, m;
  scanf("%d", &n);
  int arr1[n], arr2[n];
  for (int i = 0; i < n; i++) {
  scanf("%d", &arr1[i]);
  for (int i = 0; i < n; i++) {
     scanf("%d", &arr2[i]);
  int merged[n + n];
  mergeSort(arr1, n);
  mergeSort(arr2, n);
  merge(merged, arr1, arr2, n, n);
  for (int i = 0; i < n + n; i++) {
     printf("%d ", merged[i]);
  return 0;
```

#### 1. Problem Statement

Nandhini asked her students to arrange a set of numbers in ascending order. She asked the students to arrange the elements using insertion sort, which involves taking each element and placing it in its appropriate position within the sorted portion of the array.

Assist them in the task.

### **Input Format**

The first line of input consists of the value of n, representing the number of array elements.

The second line consists of n elements, separated by a space.

Output Format

The output prints the sorted array, separated by a space.

Refer to the sample output for formatting specifications.

#### 1. Problem Statement

You are the lead developer of a text-processing application that assists writers in organizing their thoughts. One crucial feature is a charactersorting service that helps users highlight the most critical elements of their text.

To achieve this, you decide to enhance the service to sort characters in descending order using the Quick-Sort algorithm. Implement the algorithm to efficiently rearrange the characters, ensuring that it is sorted in descending order.

#### Input Format

The first line of the input consists of a positive integer value N, representing the number of characters to be sorted.

The second line of input consists of N space-separated lowercase alphabetical characters.

### **Output Format**

The output displays the set of alphabetical characters, sorted in descending order.

Refer to the sample output for the formatting specifications.

```
Sample Test Case
    Input: 5
√a d g j k
    Output: k j g d a
    Answer
    #include <stdio.h>
    #include <string.h>
    // You are using GCC
    void swap(char* a, char* b) {
      char temp = *a;
      *a = *b:
       *b = temp;//Type your code here
    int partition(char arr[], int low, int high) {
       char pivot = arr[high]; // Choosing the last element as the pivot
      int i = low - 1; // Index of the smaller element
      for (int j = low; j < high; j++) {
         // If current element is greater than or equal to pivot
         if (arr[i] >= pivot) {
           i++; // Increment index of smaller element
           swap(&arr[i], &arr[i]); // Swap
return i + 1;//Type your code here
      swap(&arr[i + 1], &arr[high]); // Swap the pivot element with the element at i + 1
```

```
// Partition the array and get the pivot index int pi = partition(arr, low, high);

// Recursively sort elemants.
     void quicksort(char arr[], int low, int high) {
        if (low < high) {
           quicksort(arr, low, pi - 1);
           quicksort(arr, pi + 1, high);
        }//Type your code here
     int main() {
        int n;
        scanf("%d", &n);
char characters[n];
        for (int i = 0; i < n; i++) {
          char input;
          scanf(" %c", &input);
          characters[i] = input;
        }
        quicksort(characters, 0, n - 1);
return 0.

#### 1. Problem Statement

Kavya, a software developer, is analyzing data trends. She has a list of integers and wants to identify the nth largest number in the list after sorting the array using QuickSort.

To optimize performance, Kavya is required to use QuickSort to sort the list before finding the nth largest number.

# **Input Format**

The first line of input consists of an integer n, representing the size of the array.

The second line consists of n space-separated integers, representing the elements of the array nums.

The third line consists of an integer k, representing the position of the largest

number you need to print after sorting the array.

## **Output Format**

The output prints the k-th largest number in the sorted array (sorted in ascending order).

Refer to the sample output for formatting specifications.

## Sample Test Case

```
Input: 6
     -1012-1-4

#### 1. Problem Statement

Jose has an array of N fractional values, represented as double-point numbers. He needs to sort these fractions in increasing order and seeks your help.

Write a program to help Jose sort the array using the merge sort algorithm.

# **Input Format**

The first line of input consists of an integer N, representing the number of fractions to be sorted.

The second line consists of N double-point numbers, separated by spaces, representing the fractions array.

### Output Format

The output prints N double-point numbers, sorted in increasing order, and rounded to three decimal places.

Refer to the sample output for formatting specifications.

```
Sample Test Case
     Input: 4
     0.123 0.543 0.321 0.789
     Output: 0.123 0.321 0.543 0.789
     Answer
     #include <stdio.h>
#include <stdlib.h>
     // You are using GCC
     int compare(double a, double b) {
       if (a < b) return -1; // a is less than b
       if (a > b) return 1; // a is greater than b
       return 0; //Type your code here
     }
     void merge(double arr[], int I, int m, int r) {
